

Sleep & Airway Care — what it is and how it works

A plain-English overview for anyone wondering whether this applies to them.

The short version

Most people are told their snoring or exhaustion is a lung problem, a weight problem, or just getting older. I start somewhere else: **the structure around your airway** — your skull, jaw, tongue posture, neck, and the way you hold your head.

The upper airway is the one part of your breathing passage with no bones holding it open. It stays open because of muscle tone and because of the structures around it. When that structure crowds the airway, breathing at night gets harder — and you feel it the next day.

That structural layer is what I work on. It is not a replacement for sleep medicine. It is the piece the conversation usually skips.

This may be worth a conversation if you

- Snore, or your partner says you stop breathing
- Wake up gasping, choking, or with a dry mouth
- Wake up tired no matter how long you slept
- Get morning headaches
- Grind or clench your teeth
- Breathe through your mouth, day or night
- Are on CPAP and struggling with it — or gave up
- Feel foggy, irritable, or wiped out all afternoon
- Have a jaw that clicks, locks, or hurts

You don't need all of these. One or two is reason enough to look.

How it actually works

1 We talk — free, no pressure.

A short conversation about your sleep, your breathing, and what's been going on. If this isn't your problem, I'll tell you that and point you somewhere better.

2 Structural airway exam.

A hands-on look at the structure around your airway — jaw, cranium, neck, posture, tongue position, how you hold your head. Plus the standard sleep screening questionnaires.

3 Home sleep test, if it's warranted.

You sleep in your own bed with a small device. The data goes to a **board-certified physician**, who reads it and makes the call. This is the objective piece — for sleep and breathing it's what an X-ray is for a spine.

4 Report of findings.

We sit down and go through all of it — your history, the exam, the sleep study, the imaging if we did any — and I tell you honestly what I see, what I can help with structurally, and who else you may need on your team.

What I do — and what I don't

I do

- Look at the structure around your airway and how it may be affecting your breathing at night
- Screen you properly, with real questionnaires and a real exam
- Arrange a home sleep test that a physician reads
- Provide structural chiropractic care aimed at that structure
- Explain your results in language you can actually use
- Coordinate with your physician, dentist, or ENT

I don't

- **Diagnose sleep apnea.** A physician does that. I am a chiropractor; my role is structural.
- Treat sleep apnea as a medical condition, or tell you to stop a treatment another doctor prescribed
- Tell you to abandon your CPAP or your oral appliance. If those are helping you, keep using them. I work alongside them.
- Promise a cure, a number, or a guaranteed result. Anyone who promises you that is selling something.

Cost

The first conversation is free. If we go further, I'll walk you through exactly what each step costs and what your insurance may or may not cover **before** you commit to anything. No surprises, and no one gets pressured into a plan they didn't ask for.

How to start

One short call. That's the whole first step.

A NOTE FROM ME

I went through my own sleep test before I ever asked a patient to. I know what it's like to be tired for years and be told that's just how it is. If you're wondering whether any of this applies to you, ask me — that part costs you nothing but the phone call.

— Robert Zeravica, DC

Feel free to forward this to anyone who might need it.

Chiropractic care for sleep and airway concerns is structural and collaborative. Chiropractors do not diagnose or treat obstructive sleep apnea; diagnosis is made by a physician. This material is general education, not medical advice, and does not create a doctor-patient relationship or address any individual's condition. No specific outcome, result, or cure is claimed or guaranteed. If you are having a medical emergency, call 911.
